

Yes—I checked the ZIP. This is a **very strong collection**, and we should pause before downloading more. You gave us enough variety to begin real comparative analysis.

The ZIP contains:

Six full-resolution one-pagers

All are excellent 5950 × 3850 images:

1. **Genesis**
2. **Mark**
3. **John**
4. **Job**
5. **Jude**
6. **Revelation**

Four complete transcripts

1. **Genesis 1–11**
2. **Genesis 12–50**
3. **Exodus 1–18**
4. **Exodus 19–40**

The transcripts are especially valuable because they let us reconstruct the **progressive reveal** precisely—what is introduced, in what order, what earlier element it reconnects to, and how the

narrator interprets the completed composition.

Your poster selection is actually better for methodological analysis than five similar narrative posters:

Poster	Structure it can teach us
Genesis	Two-part master narrative connected by a central hinge
Mark	Three-act journey with a major turning point and unresolved ending
John	Thematic architecture: seven signs, seven “I Am” statements, controversies, and culmination
Job	Competing stakeholder perspectives, assumptions, arguments, and final reframing
Jude	Extremely compact argument with opening, problem evidence, precedents, response, and conclusion
Revelation	Nested cycles, repeated patterns, parallel sequences, symbols, escalation, and final target state

Three things immediately stand out:

- **Job may be extraordinarily useful for requirements discovery.** It visually separates what different participants believe, the assumptions beneath their positions, the central dispute, and the perspective that reframes the entire problem.
- **John is useful for thematic traceability.** Its meaning is not carried by timeline alone; repeated signs and statements connect distant portions into one logical argument.
- **Revelation is the stress test.** If we can understand how that poster controls extreme complexity without losing its governing story, we can extract techniques for large programs with many systems, releases, dependencies, and parallel workstreams.

The Genesis transcript already explicitly confirms our concept:

The storyline has two major parts, connected by a hinge story, and that design provides the clue for understanding the work as a whole.

That is almost exactly the requirements problem we are trying to solve.

I'll remember [BibleProject Downloads](#) as our canonical source for posters, transcripts, and related study materials.

My recommendation: **do not download anything else yet.** We should first analyze Genesis as the master example, using both transcripts and the completed poster. Then compare its visual grammar against Mark, John, Job, Jude, and Revelation. After that, we'll know precisely which

missing structural examples—such as cycles, rules, architecture, or parallel histories—we still need.

Genesis plz

Genesis Analysis — The BibleProject Method

Genesis confirms your original instinct: **the one-pager is the highest-level synthesis of extensive analysis, but the video is the guided path that teaches the viewer how to read that synthesis.**

The poster and presentation are one integrated product:

- The **poster** preserves the complete structure.
- The **video** controls attention and reveals the structure progressively.
- The **transcript** supplies the reasoning that connects the visual scenes.
- The **ending** explains what the accumulated picture means as a whole.

1. The poster’s master architecture

The poster is not simply arranged from Genesis 1 through Genesis 50. It has several simultaneous layers.

Visual layer	Genesis implementation	Function
Master title	GENESIS	Defines the subject
Governing thesis	God’s plan to rescue and bless his rebellious world through Abraham’s family	Explains why everything on the page belongs
Major acts	1–11: God and the World / 12–50: God and Abraham’s Family	Divides the complexity into two comprehensible movements
Central hinge	Genesis 12:1–3—land, nation, name, blessing	Converts the problem into a response
Local episodes	Creation, rebellion, flood, Babylon, Abraham, Jacob, Joseph	Makes each portion understandable
Recurring patterns	Blessing, failure, deception, violence, rescue, faithfulness	Connects separated events conceptually
Final synthesis	Judah’s future king and restored worldwide blessing	Reconnects the ending to the original purpose
Open dependency	The family remains in Egypt; promises remain incomplete	Creates the reason to continue into Exodus

The brilliance is that **chronology is only the base layer**. The deeper structure is:

2. The layout itself carries meaning

The two halves are visually different because the nature of the information is different.

Genesis 1–11: broad, organic, and interconnected

The left side concerns the whole world. It is presented as a widening downward spiral:

- Good creation
- Human choice
- Broken relationships
- Cain and Abel
- Violent civilization
- Flood
- Noah's repeated failure
- Babylon
- Scattering

The large looping lines are not decorative. They communicate **recurrence and escalation**. Later events are larger-scale manifestations of the original problem.

The design is saying:

These are not unrelated incidents. They are repeated instances of the same underlying human choice, producing increasingly extensive consequences.

That is essentially **root-cause analysis represented visually**.

Genesis 12–50: narrower and more structured

The right side shifts into vertical generational panels:

- Abraham
- Isaac and Jacob
- Jacob's sons
- Joseph

This reflects the narrative zoom:

The scope narrows from the whole world to one family, but the purpose remains worldwide.

The structure becomes more orderly, but the family's behavior remains disorderly. The page therefore preserves an important tension:

- God's plan progresses.
- Human failure continues.
- The plan survives despite the participants repeatedly endangering it.

3. The hinge is the key design device

Genesis 12:1–3 sits physically and conceptually between the two halves.

It answers the question created by Genesis 1–11:

| If humans repeatedly ruin the good world they were given, what will God do?

The answer is not yet the full solution. It is a strategic promise:

- Land
- Nation
- Great name
- Blessing
- Blessing extended to all families of the earth

This hinge performs four jobs simultaneously:

1. **Responds to the preceding problem.**
2. **Introduces the second half.**
3. **Connects backward to earlier themes.**
4. **Establishes the purpose of everything that follows.**

The transcript explicitly contrasts Abraham with Babylon:

- Babylon attempts to **make a great name** through its own power.
- God promises to **give Abraham a great name**.
- The original blessing given to humanity is now carried through Abraham's family.

So the hinge is not just a midpoint. It is a **requirements traceability junction**.

4. How the video progressively constructs the one-pager

Part 1: Genesis 1–11

Time	Narrative action	Visual-design purpose
00:00–00:33	Establishes the two-part structure and hinge	Gives viewers the map before the details
00:33–01:58	Introduces the good world, humans, purpose, blessing, and choice	Defines baseline state and governing principles
01:59–04:25	Introduces rebellion and its immediate consequences	Establishes the primary problem and causal chain
04:26–06:43	Shows recurring failure at increasing scale	Demonstrates pattern, escalation, and systemic impact
06:44–07:42	Interprets all the stories as one argument	Converts accumulated details into meaning
Ending	Asks what God will do	Creates the transition into the hinge

Notice the presentation sequence:

Baseline → choice → failure → consequences → repeated pattern → interpretation → unresolved question

The speaker does not merely narrate events. After accumulating the evidence, he pauses and says, in effect:

These diverse stories are all exploring the same basic point.

That sentence is the analytical synthesis.

Part 2: Genesis 12–50

Time	Narrative action	Visual-design purpose
00:00–00:31	Recaps the entire problem from Part 1	Restores context before continuing
00:32–02:20	Introduces Abraham and the promise	Reveals the central hinge and governing solution
02:21–04:20	Defines the two repeating themes	Gives viewers a framework for interpreting all remaining episodes
04:20–05:18	Shows the pattern intensifying through Jacob	Demonstrates repetition with variation
05:19–07:48	Brings every major theme together in Joseph and Judah	Converges the narrative

Time	Narrative action	Visual-design purpose
07:49–08:08	Identifies the unresolved future promises	Ends with both synthesis and forward dependency

The two repeating themes are:

1. Abraham’s family repeatedly fails and jeopardizes the promise.
2. God remains faithful and preserves the promise.

Once those themes are stated, the audience no longer receives the remaining stories as isolated events. They know what pattern to watch for.

That is an important lesson for requirements presentation:

Give stakeholders an interpretive framework before showing them large amounts of detail.

5. The ending changes the meaning of everything before it

Joseph’s statement—his brothers intended evil, but God redirected it toward saving lives—is strategically placed near the end.

It works at three levels:

- Explains Joseph’s individual experience.
- Summarizes the repeated family pattern.
- Reinterprets the whole book from Genesis 3 onward.

Then Jacob’s blessing of Judah reaches even farther back:

- The promised king comes from Judah.
- He will command the nations.
- He will restore the worldwide blessing.
- This reconnects to the original good world and the promised defeat of evil.

Therefore, the ending is not just “what happened last.” It is the **final synthesis lens** through which the viewer re-reads the entire poster.

And yet Genesis ends with the family in Egypt and the promises incomplete. The ending performs two seemingly opposite tasks:

- It provides conceptual closure.
- It preserves operational incompleteness.

That creates the natural transition into Exodus.

6. What we should borrow for requirements design

We should adapt the information-design principles without copying BibleProject’s artwork or branded visual style.

Proposed requirements equivalent

Genesis device	Requirements equivalent
Genesis title	Initiative or transformation name
“The Point”	Fundamental business tension
Governing thesis	Business outcome and transformation hypothesis
Genesis 1–11	Current world, originating problem, and accumulated consequences
Genesis 12 hinge	Mandate, decision, capability, or pivotal requirement
Genesis 12–50	Target-state transformation and delivery journey
Repeated human failure	Recurring operational pain, defect pattern, or control failure
Blessing/faithfulness theme	Preserved business objective or invariant
Looping connections	Traceability across causes, systems, rules, and requirements
Generational panels	Releases, workstreams, capabilities, or lifecycle stages
Joseph synthesis	Proof that the proposed design resolves the central problem
Future king/open promise	Target-state value and remaining roadmap

7. A first draft of our master requirements composition

A BibleProject-inspired requirements one-pager could use this architecture:

Top: governing meaning

- Initiative name
- One-sentence transformation thesis
- Business purpose
- Two or three persistent themes

Left: the world before the change

- Original operating intent

- Current actors and systems
- Triggering limitation
- Repeated failure patterns
- Business and regulatory consequences
- Why localized fixes have failed

Center: the hinge

- The strategic decision
- The pivotal capability
- The non-negotiable business outcome
- The requirement that changes the direction of the story

Right: the transformation

- Capabilities or workstreams
- System and data changes
- Release progression
- Exception handling
- Controls
- Stakeholder outcomes

Ending: synthesis and value

- How the proposed state resolves the opening tension
- How major requirements connect
- What value is restored or created
- What remains for later releases
- Links to detailed supporting artifacts

8. The most important conclusion

The Genesis method is not:

| Put every requirement on one page.

It is:

| Discover the few governing ideas that make hundreds of details intelligible, organize the details around those ideas, and reveal the structure in an order that allows stakeholders to understand why everything connects.

The final one-pager must preserve four kinds of understanding simultaneously:

1. **Sequence:** What happens and in what order?
2. **Causality:** Why does one condition produce another?
3. **Pattern:** What repeats across different parts of the system?
4. **Purpose:** How does the ending resolve the problem introduced at the beginning?

That is the first foundational principle of our method:

A requirements one-pager is not a compressed requirements document. It is a visual argument explaining the design of the change.

what's next?

Worked for 9s

The immediate next step is **not another broad poster analysis yet**. We need to convert Genesis into a precise, reusable design specification.

Next: Genesis reveal storyboard

I'll map the two videos minute by minute and record:

For every reveal	What we capture
Narrative statement	What the narrator explains
Visual addition	What appears on the canvas
Placement	Why it appears in that location
Connection	What earlier element it references
Function	Context, problem, cause, pattern, hinge, resolution, or open question
Final destination	Where it remains on the completed poster
BA equivalent	How we would use the same technique in requirements work

That will reveal things the final poster alone cannot show:

- What appears first
- What information is intentionally delayed
- When the audience is given the overall structure
- When local incidents become a recognizable pattern
- When the governing thesis is revealed
- How earlier details are recalled near the ending

- How the final zoom-out produces understanding

Then: compare Genesis with Job

Job is the best second case because it is structurally different:

- Genesis is an unfolding end-to-end narrative.
- Job is a problem investigation involving competing perspectives, assumptions, debates, and a final reframing.

The comparison will help us separate:

- **Universal BibleProject principles**
- **Techniques specific to chronological stories**
- **Techniques suitable for stakeholder disagreement and requirements discovery**

Then we produce Method v0.1

The initial method will include:

1. **Governing Thesis**
2. **Narrative Acts**
3. **Baseline World**
4. **Triggering Tension**
5. **Escalating Evidence**
6. **Central Hinge**
7. **Recurring Patterns**
8. **Resolution and Value**
9. **Open Dependencies**
10. **Supporting-document links**
11. **Progressive presentation sequence**

After that: Fidelity prototype

Only after extracting the reusable grammar should we apply it to Fidelity Rep Code Expansion:

- Current three-character world
- Four-character expansion pressure
- Legacy-system conflict
- Silent truncation risk
- Central translation/mapping capability as the hinge
- Transformation across pre-trade and post-trade systems

- Controls, exceptions, lineage, and auditability
- Final business outcome

So the working sequence is:

Genesis storyboard → Job comparison → Method v0.1 → Fidelity content model → first one-pager prototype

I recommend proceeding now with the **Genesis video-to-poster reveal storyboard**. That is the missing bridge between our poster analysis and a repeatable requirements method.
