

Interview QA - Senior BA AEGIS Services

Practice Questions + Draft Answers

1. Tell me about yourself.

Draft answer:

I'm a Senior Business Analyst and Application Support professional with experience across insurance, financial systems, SDLC delivery, QA/UAT coordination, and production releases. Most recently, I supported a business-critical financial market data application at the Federal Reserve Bank of New York through Gresham, where I worked across business users, infrastructure, database, and operations teams to coordinate releases, support production issues, validate deployments, and document runbooks.

Earlier in my career, I worked in insurance environments at EmblemHealth, AIG Property Casualty PMO, and AIG Travel Guard, where I supported requirements, UAT, enhancement requests, reporting, training materials, and workflow improvements. What I bring is the ability to bridge business needs and technical delivery in regulated enterprise environments.

2. Why are you interested in AEGIS and this Senior Business Analyst role?

Draft answer:

The role interests me because it sits at the intersection of business applications, application support, requirements, QA/UAT, and production delivery. That is very close to the work I've done throughout my career. I also like that AEGIS is in the insurance space, because I have prior experience at AIG, AIG Travel Guard, and EmblemHealth. I see this as an opportunity to bring together my insurance background and my more recent hands-on application support and release coordination experience.

3. Describe your experience with application support.

Draft answer:

In my most recent role, I supported a streaming market data application operating across Linux, Oracle, and AWS infrastructure. My role included production application support,

troubleshooting coordination, deployment readiness, post-release health checks, and working with technical teams to resolve issues across development, QA, and production environments.

I was not just gathering requirements; I was involved through the full lifecycle — from requirements and user stories to testing, deployment validation, support documentation, and production readiness.

4. Tell me about your experience with QA and UAT.

Draft answer:

QA and UAT have been a consistent part of my work. At Gresham/Federal Reserve, I created and executed Pre-QA test plans for streaming price cleansing workflows and key functional items. I also validated deployment steps, health checks, and post-release readiness.

At EmblemHealth and AIG, I developed test plans from requirements, coordinated UAT, worked with stakeholders for signoff, and helped ensure that business users could validate functionality before production deployment.

5. How do you gather and manage requirements?

Draft answer:

I usually start by understanding the business problem, the current workflow, the impacted users, and the operational pain points. Then I translate that into requirements, user stories, acceptance criteria, test scenarios, and implementation notes.

In my recent role, I developed actionable Jira user stories from high-level epics while working with the Product Owner and Scrum Master. I also prioritized functional and non-functional requirements from business, infrastructure, and architecture stakeholders into release scope.

6. How have you worked with technical teams?

Draft answer:

I'm comfortable working closely with developers, database teams, infrastructure, DevOps, operations, and business users. My role is often to make sure the business need is clearly understood, the technical teams have enough detail to implement, and the business users can validate the result.

For example, in my most recent role, I coordinated deployment activities between business users, infrastructure, database, and operations teams to support successful production releases.

7. What is your ServiceNow experience?

Draft answer:

My ServiceNow experience has been from the operational and workflow side rather than as a platform administrator. I used ServiceNow to coordinate software access, tooling, infrastructure requests, and support/change workflows. In that sense, I understand ServiceNow as more than just a ticketing tool — it supports enterprise workflows, approvals, task assignment, audit trail, and operational coordination.

8. Tell me about your insurance industry experience.

Draft answer:

I have direct insurance experience through EmblemHealth, AIG Property Casualty PMO, and AIG Travel Guard. At EmblemHealth, I worked in EPMO Operations supporting requirements, test plans, UAT, reporting metrics, rollout materials, and funding workflow realignment. At AIG Property Casualty PMO, I worked on HP PPM and Business Objects enhancement requests, requirements clarification, UAT planning, and stakeholder communication. At AIG Travel Guard, I supported global travel insurance system enhancements, e-business operations, distribution channels, and project closure activities.

9. Tell me about a time you had to manage changing priorities.

Draft answer:

In release and application support work, priorities can change quickly because production readiness, QA defects, business needs, and infrastructure constraints all compete for attention. I handled that by keeping a clear view of release scope, risk, dependencies, and stakeholder impact.

At Gresham/Federal Reserve, I prioritized functional and non-functional requirements from business, infrastructure, and architecture teams into releases. When issues came up, I focused

on impact, urgency, dependencies, and whether the change affected production readiness or user acceptance.

10. How do you ensure quality in application changes?

Draft answer:

I focus on quality throughout the lifecycle, not just at the end. That means clear requirements, acceptance criteria, testable user stories, QA test plans, UAT coordination, deployment validation, and post-release checks.

In my recent role, I created Pre-QA test plans, tested deployment steps and scripts, validated post-release health checks, and maintained runbooks and troubleshooting procedures. That helped reduce ambiguity and made releases more repeatable.

11. What is your experience creating documentation, job aids, or training materials?

Draft answer:

I've created several types of documentation, including operational runbooks, deployment documentation, troubleshooting procedures, support knowledge bases, rollout materials, quick reference guides, and user training materials.

At AIG, I published a Business Objects Quick Reference Guide for self-service training. At EmblemHealth, I prepared rollout materials and training for the PPM Resource Management module. More recently, I maintained runbooks and support documentation using Confluence and Visio.

12. What would you say is your biggest strength for this role?

Draft answer:

My biggest strength is that I can operate comfortably between business users and technical teams. I understand requirements, workflows, testing, production support, and release coordination. I also have prior insurance experience, so I'm familiar with regulated enterprise environments where documentation, approvals, quality, and stakeholder communication matter.

Best Starting Practice Order

Start with these five:

1. Tell me about yourself.
2. Why AEGIS?
3. Describe your application support experience.
4. Tell me about QA/UAT experience.
5. What is your ServiceNow experience?

Send me your answer to question 1 first, and I'll tighten it.
